## MATH 10 <br> ASSIGNMENT 2: OPEN AND CLOSED SETS

SEPT 24, 2017

Definition 1. A metric space is a set $X$ with a distance function: for any $x, y \in X$ we have a real number $d(x, y)$ such that

1. $d(x, y)=d(y, x)$
2. $d(x, y) \geq 0$ for any $x, y$
3. $d(x, y)=0$ if and only if $x=y$
4. Triangle inequality: $d(x, y)+d(y, z) \geq d(x, z)$.

Usual examples are $\mathbb{R}, \mathbb{R}^{2}, \ldots$, but there are other examples as well.
Given a point $x \in X$ and a positive real number $\varepsilon$, we define $\varepsilon$-neighborhood of $x$ by

$$
B_{\varepsilon}(x)=\{y \in X \mid d(x, y)<\varepsilon\}
$$

If $S \subset X$, denote by $S^{\prime}$ the complement of $S$. Then, for any $x \in X$, we can have one of three possibilities:

1. There is a neighborhood $B_{\varepsilon}(x)$ which is completely inside $S$ (in paritcular, this implies that $x \in S$ ). Such points are called interior points of $S$; set of interior points is denoted by $\operatorname{Int}(S)$.
2. There is a neighborhood $B_{\varepsilon}(x)$ which is completely inside $S^{\prime}$ (in paritcular, this implies that $x \in S^{\prime}$ ). Thus, $x \in \operatorname{Int}\left(S^{\prime}\right)$.
3. Any neighborhood of $x$ contains points from $S$ and points from $S^{\prime}$ (in this case, we coudl have $x \in S$ or $\left.x \in S^{\prime}\right)$. Set of such points is called the boundary of $S$ and denoted $\partial S$.

Definition 2. A set $S$ is called open if every point $x \in S$ is an interior point: $S=\operatorname{Int}(S)$. A set $S$ is called closed if $\partial S \subset S$.

## Homework

1. Show that set $\mathbb{R}^{2}$ with distance defined by

$$
d\left(\left(x_{1}, y_{1}\right),\left(x_{2}, y_{2}\right)\right)=\left|x_{1}-x_{2}\right|+\left|y_{1}-y_{2}\right|
$$

is a metric space. (This distance is sometimes called Manhattan or taxicab distance - can you guess why?)
2. For each of the following subsets of $\mathbb{R}$, find its interior and boundary and determine if it is open, closed, or neither.
(a) Set $\mathbb{N}=\{1,2,3, \ldots\}$.
(b) Interval $[0,1]]$
(c) Open interval $(0,1)$
(d) Interval $[0,1)$.
(e) Set of all rational numbers
(f) Set consisting of just two points $\{0,1\}$
*(g) Set $x^{3}+2 x+1>0$
Are there any subsets of $\mathbb{R}$ which are both open and closed?
3. Show that a set $S$ is open if and only if its complement $S^{\prime}$ is closed.
*4. For a set $S$, let $\bar{S}=S \cup \partial S=\{x \mid$ In any neighborhood of $x$, there are elements of $S\}$. Prove that $\bar{S}$ is closed. (It is called the closure of $S$.)
5. Show that union and intersection of two open sets is open. Is it true if we replace two sets by any collection of open sets?

Same question about closed sets.
