Math 4 d. Class work 22.

Sets.

I put a pencil, a book, a toothbrush, a coffee mug, and an apple into a bag. Do all these objects have something in common?

A set is a collection of objects that have something in common.

Can we call this collection of items a set? What is a common feature of all these objects? They are all in the bag, where I put them.

There are two ways of describing, or specifying, the members of a set. One way is by listing each member of the set, as we did with our set of things.

I can create, for example, a set of several flowers (F):

 $F = \{rose, tulip, daffodil\}.$

The name of the set is usually indicated by a capital letter, in my case is F, list of members of the set is included in curved brackets. I can also create a set of all flowers, (N):

$$N = \{n \mid n = flower\}$$
(1)

Of cause, I can't itemize all possible flowers, there are too many of them, we don't have enough space here for that, but I can describe the common feature of all members of the set – they are all flowers. In the mathematical phrase above (1) I described this set, I call it N, also the set contains an unknown number of items, (I

really don't know how many various flowers exist). I use variable *n* to represent these items, each of which is a flower. I show it by the phrase n = flower.

Exercise:

1. Give examples of several members of the following sets:

Example:

 $M = \{x \mid x = mammals\}$

A

4

2

6

С

8

x can be a lion, a whale, a bat...

- a. $K = \{y | y = letter of english alfabet\}$
- b. $M = \{x | x = animal\}$
- c. $X = \{m \mid m = even number\}$
- d. $P = \{k | k = color\}$

 $A = \{2, 4, 6, 8\}$ $B = \{d, e, s, k\}.$

The second way is by using a rule:

Venn diagram.

B

D

d

е

k

C is the set of four first even natural numbers. *D* is the set of letters of the word "desk".

Two sets are equal if they contain exactly the same elements. If we look closer on our sets A and C we can see that all elements of set A are the same as elements of set C (same goes for sets B and D).

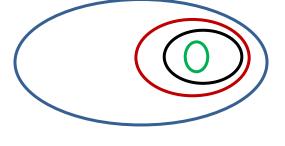

A=C and B=D

If set *A* contains element '2', then we can tell that element '2' belongs to set *A*. We have a special symbol to write it down in a shorter way: $2 \in A$, $105 \notin A$. (What does this statement mean?)

Let's define several sets.

Set *W* will be the set of all words of the English language. Set *N* will be the set of all nouns existing in the English language. Set *Z* will be the set of all English nouns which have only 5 letters. Set $T = \{$ "table" $\}$. On a Venn diagram below name all these sets:

If all elements of one set at the same time belong to another set then we can say that the first set is a subset of the second one. We have another special symbol to write this statement in a shorter way: \subset .

$T \subset Z \subset Y \subset W$

If set V is defined as a set of all English verbs, can you draw a diagram for set V on the picture above? Can you tell subset of which set V is?

$$V \subset ___$$

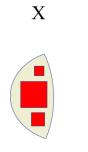

$$V \not\subset ___$$

$$V \not\subset ___$$

$$V \not\subset ___$$

When several sets are defined it can happen that in accordance with all the rules we have implied several objects can belong to several sets at the same time. For example, on a

picture set S is a set of squares and a set R is a set of red figures. A few figures are squares and they are red, therefore they belong to both sets. Thus we can describe a new set X containing elements that belong to the set S as well as to the set R. The new set was constructed by determining which

_

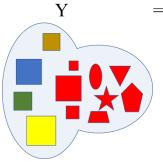

members of two sets have the features of both sets. This statement also can be written down in a shorter version by using a special symbol \cap . Such set *X* is called an **intersection** of sets *S* and *R*.

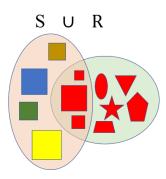

$X = S \cap R$

Another new set can be created by combining all elements of either sets (in our case S and R). Using symbol \cup we can easily write the sentence: Set Y contains all elements of set S and set R:

$$Y = S \cup R$$

Such set *Y* is called a **union** of set *S* and *R*. Set which does not have any element is called an empty set, in math people use symbol \emptyset).

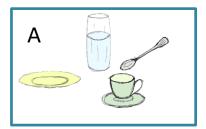

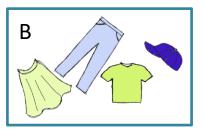

E	element belongs to a set
¢	element does not belong to a set
\subset	one set is a subset of another set
¢	one set is not a subset of another set
Ω	intersection of two sets
U	union of two sets
Ø	empty set

Exercises:

- 1. A = {a, b, c}, B = {1, 2, 3, 4}. Write the intersection (A \cap B) and the union (A \cup B) of these two sets.
- 2. Which word we can use to describe a set, subset of which is drawn on the pictures below:

List a few other members of these sets.

3. There are 20 students in a Math class. 10 students like apples and 15 students like pears. Show that there are some students who like both apples and pears.

Assume that each student likes at least one of the fruits. (This means that each student like either apples, or pears, or both). How many students like both pears and apples? Is it possible to determine if there any students who do not like apples and do not like pears? If yes, explain how you can do it. If no, demonstrate by giving examples.

4. The same Math class (with 20 students) forms a soccer team and a basketball team. Every

student signs up for at least one team:

- 12 students play only soccer;
- 2 students play both soccer and

How many students play basketball only?

5. Students who participated in math coopetition had to solve 2 problems, one in algebra and another in geometry. Among 100 students 65 solved algebra problem, 45 solved geometry problem, 20 students solved both problems. How many students didn't solve any problem at all?

- 240 students from New-York and Seattle attended a math camp. Of the total number of students, 125 were boys. 65 boys were from New-York. There were 53 girls from Seattle. How many students came from New-York?
- 7. In 2 boxes there are 160 notebooks altogether. In one box there are 20 more notebooks than in the other. How many notebooks are there in each box?
- 8. On the diagrams of sets A, and B put 4 elements so that (just draw 2 points, or put any two letters).
 - a. each set contains 3 elements
 - b. set A contains 2 elements, set B contains 4,
 - c. set A contains 4 elements, sets B contains 3 elements,
 - d. set A contains 0 elements, set B contains 4 elements,
 - e. each set contains 2 elements,
 - f. each set contains 4 elements.
